WORK EXPERIENCE

October 2017 - Present

Unify Digital

Front end developer

- I worked closely with a designer to implement custom UI components for a social media platform. The components in the single page application are responsive and fits from a mobile view to a desktop view.
- I inherited a legacy project where the UI components were not as satisfactory as I thought it should be. With the permission of the Technical Lea, I took the initiative to redesign and refactor the components to fit better with the client's branding and expectation. After showing the final result to the Technical Lead and the client, they were impressed by the quality of the final product.

June 2017 - September 2017

Digital Arts Network Auckland

Junior Experience Designer (3 months contract)

- I code and built a prototype website for a brand refresh using Nunjucks, SASS, Javascript, Node.js, Gulp.js, and Github. Agile methodology was used for this project and there was a strong collaboration between me and the designers. I participated in a series of user testing sessions to understand better how the user interacts with the website and what they think about the animations that I implemented.
- I designed, built and deployed a single webpage to promote a new service feature. The page was built from an existing HTML template but it was heavily customised to fit the company's brand and content. The link to the site is www.dan.co.nz/ux-lab
